More particularly, the present invention relates to a rechargeable battery apparatus which is composed of a plurality of rechargeable batteries connected in series to each other, where a voltage level is adjusted by controlling a voltage applied to an electrode of each rechargeable battery. 2. Description of the Related Art Recently, electronic devices have been miniaturized and adopted various functions, and accordingly, rechargeable batteries are also becoming smaller in size while becoming multifunctional. In particular, rechargeable batteries have become popular for their use in portable telecommunication equipments. These portable telecommunication equipments have become smaller, lighter, and multifunctional, and

accordingly, rechargeable batteries have become smaller and lighter as well. However, in a case where a plurality of rechargeable batteries are connected in series, the energy density in a rechargeable battery is constant, and therefore the energy density in the rechargeable battery is lowered as the number of rechargeable batteries is increased. Therefore, conventional rechargeable batteries have been designed in order to decrease the voltage drop by using a method of connecting rechargeable batteries in series. For example, some electronic devices are equipped with a rechargeable battery capable of discharging two times or more, and the rechargeable battery used in such electronic devices comprises a plurality of rechargeable batteries connected in series, and the voltage applied to each rechargeable battery is controlled to be constant at a predetermined level. In addition, the aforementioned conventional rechargeable battery has a disadvantage in that a complicated circuit is required in order to adjust the voltage applied to each rechargeable battery. Therefore, there is a need for a rechargeable battery which can adjust the voltage applied to each rechargeable battery without requiring a complicated
